EVENT JOURNEY CARD

Problem Statement

Event information is managed across individual people, disconnected communication channels, and separate stages without a centralized system for ownership, updating, and distribution, causing information to be lost, delayed, or inconsistent from planning through post-event communication.

Root Cause

Lack of a centralized information management system with clear ownership and defined information flow.

A personalised, continuously updated digital card that stays with the attendee from registration to post - event, bringing all essential information in one place. The attendee gets one link that stays relevant throughout the entire event journey.

Behind the attendee-facing card is a centralized organizer dashboard where different teams — registration, venue, program, etc. — can update the information they are responsible for.

ONE LINK | REAL-TIME | PERSONALIZED | NO APP

01

One source

Attendee checks one place instead of searching across channels.

02

Always current

Approved changes flow to the same attendee link.

03

Complete journey

Registration → before → event day → post-event.

Why this direction fits the problem

1	**Dependency on specific people**	Attendee can self-serve key information through one personal card.
2	**Important details get scrambled**	Different team inputs are connected through one information source.
3	**Delayed / rushed announcements**	Approved changes can trigger an update to the same attendee link.
4	**Communication drops after registration**	The card remains useful before, during and after the event.

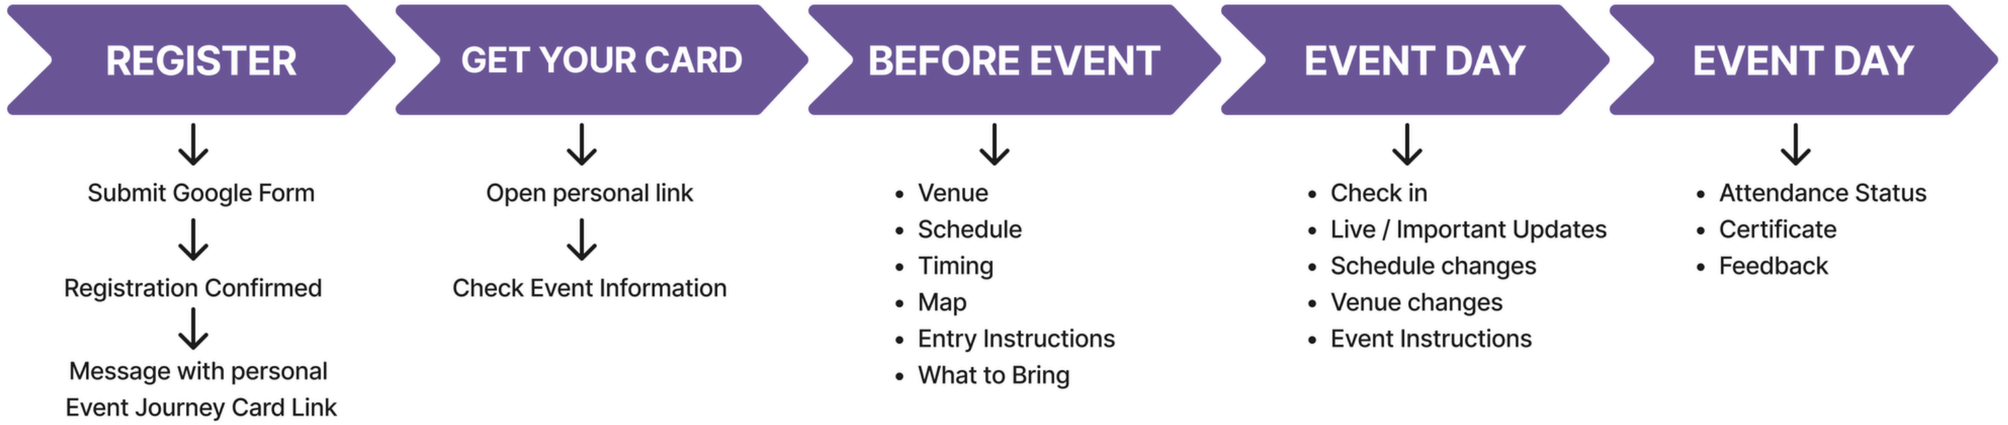

WHY ATTENDEE-FIRST?

Because the attendee is the point where fragmented information becomes visible.

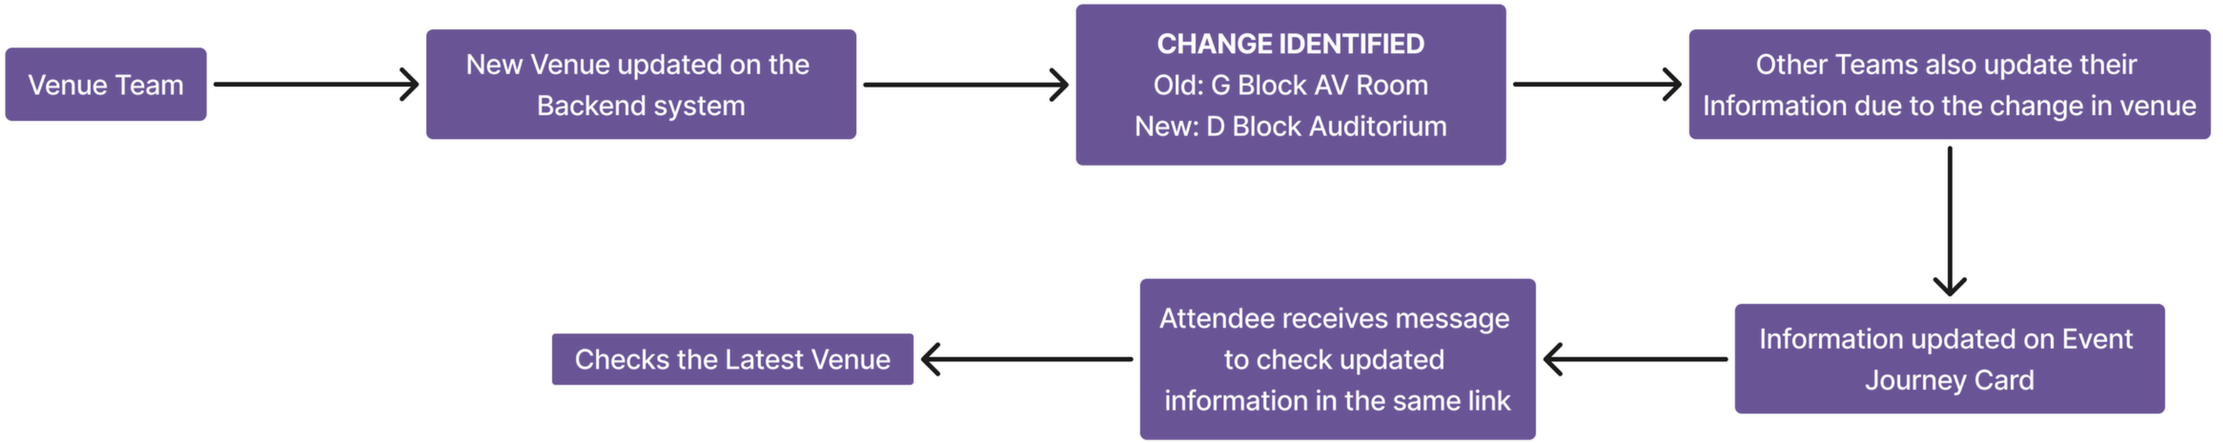

Uses existing behaviour	Register online → open a link → check updates on phone
No app download	Works as a web-based personalized card
Does not replace teams	Teams still own the information they are responsible for
Makes the system visible	The attendee experiences one continuous information journey

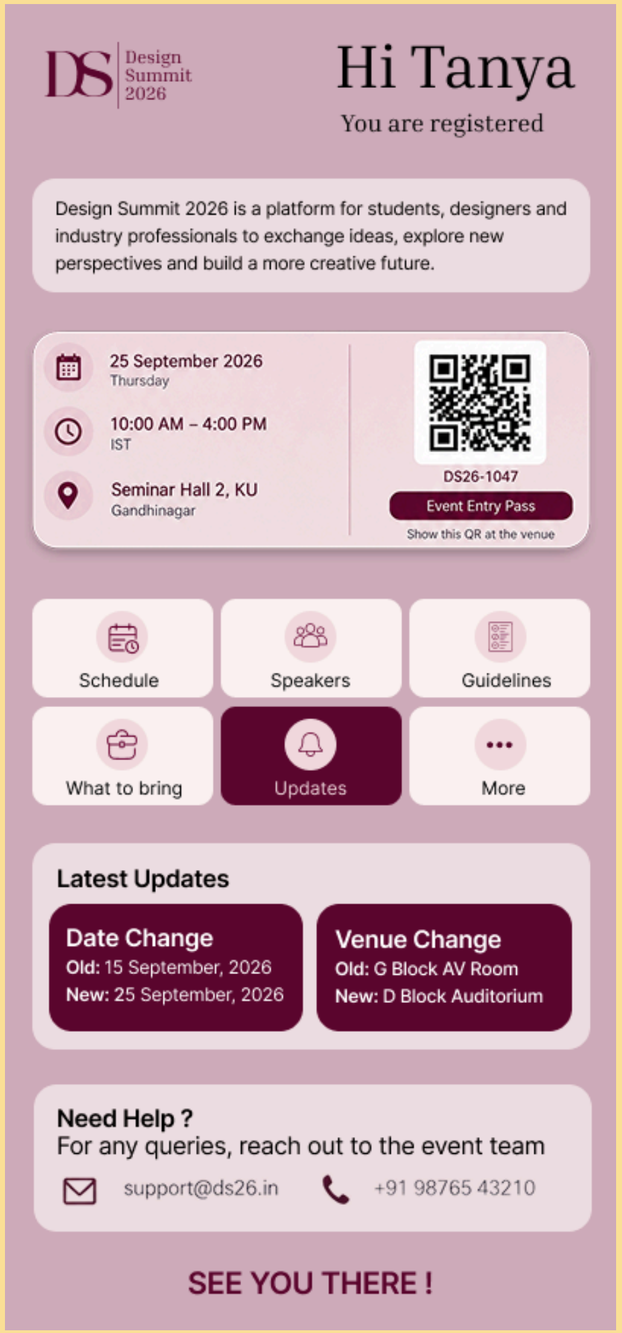

ONE INFORMATION SOURCE → MANY PERSONALIZED VIEWS

Attendee Journey

Updated information Flow

01 **Identity** — Name + registration status

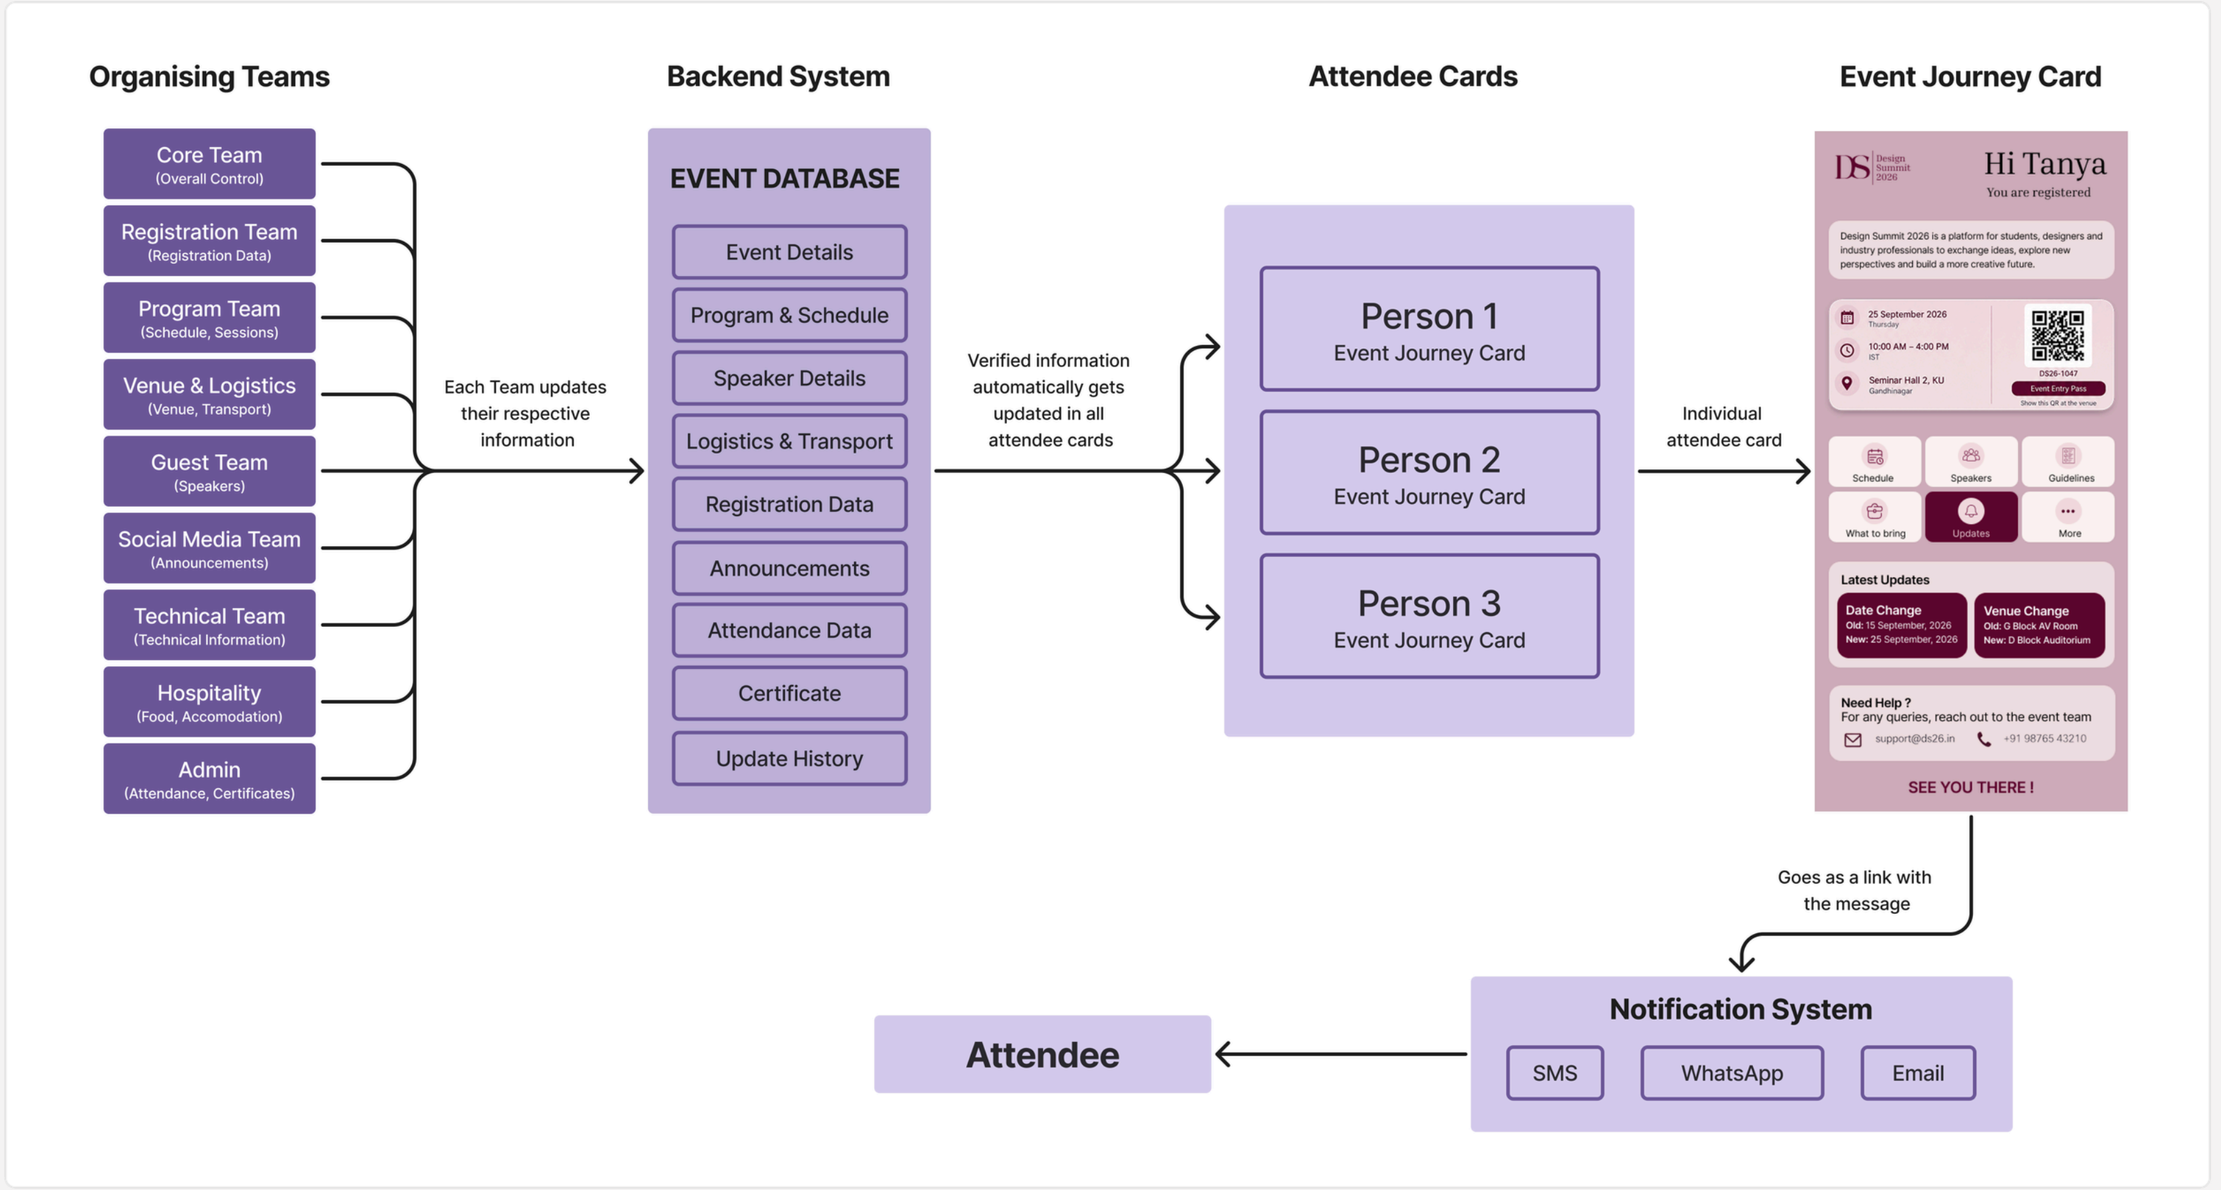

02 **Core event details** — Date · time · venue · QR

03 **Journey information** — Schedule · speakers · travel · guidelines

04 **Live updates** — Changes highlighted on the same link

05 **Post-event** — Attendance · certificate · feedback

Proposed System

Existing Issue	How Event Journey Card Addresses It
Dependency on specific people	Attendees no longer need to ask a particular organizer for information. Important information is available directly through their card.
Important details get scrambled	Information from different teams is brought together into one structured event information system instead of being scattered across different channels.
Delayed decisions / rushed announcements	When an important detail changes, the responsible team can update the central information source and the change can be reflected on attendee cards immediately.
Communication drops after registration	Registration becomes the beginning of the attendee journey rather than the end. The attendee continues receiving relevant information before, during and after the event.

Success Metrics

≥90% - Attendees find information without contacting organizers

≤5 minutes - Approved updates are reflected on attendee cards

≥50% - Reduction in basic information-related queries

≥90% - Attendees access their card across the full event journey

Thank you!
